Intro to CS Practice Python Quiz #1

On paper, closed computer, notes, and books

In the space below, write a Python program that asks the user to enter a positive integer. Then ask the user to enter a second positive integer that is different from the first number that was entered. After getting the two integers from the user, if the first number is larger, your program should display the word "yes". If the second number is larger, display the word "no".

Your code must be formatted properly (letter case, punctuation, indents, blank lines, etc.), but your program does NOT need to contain any comments. You may use global variables and, if you like, you may put all of your code into the main area of the program (that is, you do NOT need to use functions).
